cryptographic coding is the practice and study of techniques for secure communication in the presence of third parties (called adversaries). More generally, it is about constructing and analyzing protocols that block adversaries; various aspects in information security such as data confidentiality, data integrity, authentication, and non-repudiation are central to modern cryptography.

~~Information Theory and Coding — University of Cambridge~~

Information theory studies the quantification, storage, and communication of information. It was originally proposed by Claude Shannon in 1948 to find fundamental limits on signal processing and communication operations such as data compression, in a landmark paper titled "A Mathematical Theory of Communication". Its impact has been crucial

know. But almost all modern communication engineering is based on that work. [Fano, R. Quoted in Technology Review, Jul 2001] The noisy channel coding theorem is what gave rise to the entire field of error-correcting codes and channel coding theory: the concept of introducing redundancy into the digital representation to protect against corruption.
